Turning everyday street experience into usable insight for urban decision-making

Cities need to adapt streets to heat, flooding and everyday safety, yet decisions are still shaped by data that often misses how streets are actually experienced.

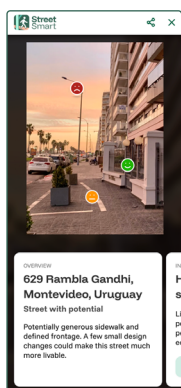

StreetSmart is a civic-tech methodology and platform that captures how streets perform in everyday use, combining street-level observation, participant input and AI-assisted image analysis.

It reveals conditions such as comfort, safety, shade, greenery and movement — generating clear, usable evidence to guide street design and climate adaptation.

STREETSMART AT A GLANCE

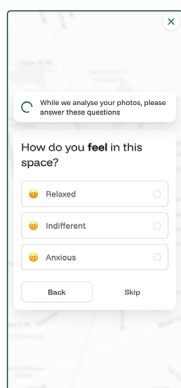

1 Analyse

AI-assisted analysis of street photos to assess liveability conditions

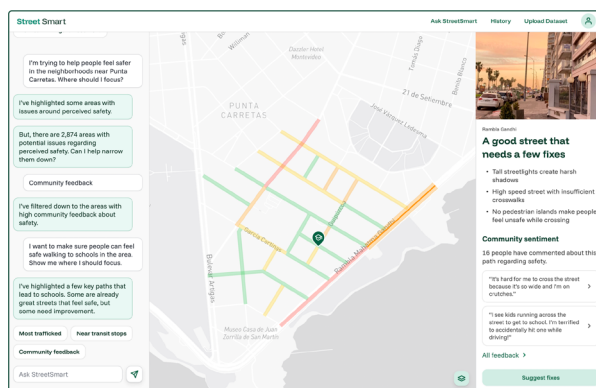

2 Express

People describe how it feels to use the street (cross, wait, rest, move)

3 Inform

Clear visual evidence to support design, prioritisation and dialogue

PILOT APPROACH

Facilitated street audit combining a walkshop and a digital tool

Snap

Photograph selected street segments

Reflect

Short prompts capture lived experience

Assess

Analysis of pavements, crossings, shade, greenery, traffic conditions

Input

Participants validate and enrich observations

Debrief

Collective discussion to identify priorities

WHAT IT ENABLES

- Rapid diagnosis of street conditions
- Identification of priority areas
- Shared understanding between communities and decision-makers
- Earlier input into planning decisions

OUTPUTS

- Pilot summary with key insights and visual mapping
- Priority areas and quick-win recommendations
- Evidence base for local authorities
- Framework for scaling

IMPLEMENTATION

- Delivered through a guided process combining the platform, a walkshop and facilitation.
- The methodology and interface are adapted to the context and objectives of each project.

We are currently in private beta. Pilot collaborations and partnerships available.
